Abstract—This project presents a web-based platform that helps user discover places to visit in Cambodia. This travel website provides information about destinations, categories, and other essential details to help users choose where to go. It is designed to be simple, user-friendly, and responsive to different devices. The system aims to make it easier for users to explore new locations in Phnom Penh.

Keywords—travel website, responsive, explore, locations.

I. INTRODUCTION

Moving to the city can be challenging for students, especially when they are unfamiliar with the city, new environment, and places to visit. Many new students who just arrived in Phnom Penh struggle to find affordable places to eat, study-friendly cafés, entertainment spots, and essential locations to support their daily life. Although a lot of travel and map applications exist, they often lack students and newcomers-focused recommendations and localized guidance.

To help fix this issue, this project introduces a web-based platform designed specifically for students and newcomers to explore and settle their life in Phnom Penh more easily. The website will provide information about popular hangout places, affordable places that students can go eat at, and spots that help them with their daily life. It is designed to be simple, easy to use, and helpful for students and newcomers who are trying to settle into the city. By giving clear and useful suggestions, the website helps students feel more comfortable in their new environment.

II. RELATED WORKS

Several existing platforms provide travel or location recommendations, such as Google Maps, TripAdvisor, Whoo and local Facebook pages. These platforms help users discover new places and attractions. However, most of them show all available places in Phnom Penh, which can overwhelm users with too much information. As a result, users may find it difficult to decide where to go, especially if they are new and unfamiliar with the options.

Unlike these large global platforms, This project will provide a web-based platform that narrowed down the options and recommend only few options that will help users with

their daily needs, making it easier for users to quickly find places to eat, hang out and explore as they get used to life in the city.

III. MAIN FEATURE

The main feature of this website is location recommendation(tvna). It shows the options that we narrowed down and is actually what the user need .

TvNa Community. Users can view places that are recommended by other users.

Favorites. This feature will show the user of the places that the user save to the favorites folder, making it easier to find and revisit them later.

IV. PROJECT MOTIVATIONS

Planning and deciding where to go on a date or a hangout can be a hassle, people usually find it hard to look for a proper place that is suitable for those things. Having too many options could also make people become indecisive. On the other hand, one of the main motivations for this project also comes from a very personal experience. As a newcomer in Phnom Penh, we wanted to find places to hang out where we could do our assignments with friends or plan a random date etc. We didn't know which specific spot was suitable, affordable and offered a lot of activities that we can do and have fun together. Searching on Google Maps and other websites was overwhelming because it showed all the available spots in the city. This inspires us to create a website that provides just the place that the user needs, along with a community feature where users can discover new locations that are recommended by others. Long story short, we have no idea where we should go when trying to invite someone to go on a date.

V. FUTURE PLAN

In the future, we plan to develop this platform into a mobile application instead of a web-based system. We also aim to expand beyond Phnom Penh to cover other cities and provinces while giving users the choice of choosing the area they want. The app will include a satellite-style world map with location pins, allowing users to explore and discover recommended places more interactively.
