

Story

You're building the playlist engine for a campus radio app. There is always a **current song** (a cursor). DJs must be able to:

1. move to the **next** song
2. move to the **previous** song
3. **insert** a song **after** the current one
4. **remove** the **current** song
5. **jump** to the **first** or **last** song
6. **repeat**: after the last song, the **next** song is the **first** (wrap-around)
7. **print** the playlist **forward** and **backward** starting from the current position
